## 1 Form generator

Form generator, briefly *FormGen*, is a class module for *Basic4Android* which allows to build and handle forms data; it is sufficiently generalized for a wide use.

### 1.1 Using the form generator

Before use FormGen the class `fgen` must be instantiate:

```
Sub Globals
    ...
    Dim fg As fgen          ' instantiate Form Generator class
    ...
End Sub
...
fg.Initialize
```

The form is generated by calling the `fg` method:

```
instantiatedName.fg(activity, dataDescription, callingModule, subHandleAnswer, subHandleEvents)
```

where `activity` is the activity which will contains the form, `dataDescription` is a character string containing the form components description, `callingModule` is an activity module or a class module, `subHandleAnswer` and `subHandleEvents` are characters string containing the name of the sub for handle data when the form is closed and the possible sub for handle events or an empty string if you wouldn't handle events.

If the form is only for show data `subHandleAnswer` must be an empty string.

Example:

```
...
Dim parms As String = "Slide,,5,S,3,10 -10;Rdb,Sexe,,10,,M:Male|F:Female;"
...
fg.fg(Activity,Parms,Me,"handleAnswerTest","handleEvents")
...
fg.fg(Activity,Parms,Me,"handleAnswerTest","");
...
```

### 1.2 Data description

Every view (or widget) is characterized by a list of attributes, comma separated, in this order: view Type, Field Name, Field Label, Length, Default Value and Extra(s). Views are separated by semicolon.

In addition to the views there can be some others information (*Pseudo types*) with different semantics that will be detailed in the paragraphs dedicated to them.

If the view list starts with '`'` it is a comment which `'` must also be terminated by semicolon.

#### 1.2.1 View Type

The Types are indifferent to case.

- Buttons:
  - **B** button;
  - **R** radio button, a set of Radio buttons;
- **CKB** check box;

- Spinners (or Combo boxes):
  - **CMB** spinner;
  - **CMT** is a spinner with Text associated for insert values not in spinner;
  - **F** file and directory;
- Text fields:
  - **C** comment;
  - **N** numeric field;
  - **DN** decimal numeric field;
  - **IN** absolute integer;
  - **Date**;
  - **H** or **HIDDEN** hidden field;
  - **S** seek bar or slider is an extension of the standard control;
  - **QS** qualitative slider;
  - **P** password field, the data entered are masked;
  - **T** text field is the default if the Type is omitted;
  - **Time**;
  - **U** not modifiable field i.e. a protected field.

### 1.2.2 View Name

Is the name of the field that, when the form is closed, is returned with the value associated; the name is case-sensitive and it is used to access data and possibly handle the views.

The *name* of comments (type **C**) is meaningless and it is ignored.

### 1.2.3 View Label

Label of widget or caption of button, if omitted it is used the Field Name.

The *label* of comments (type **C**) is meaningless and it is ignored.

### 1.2.4 View Length

The length of the view in characters; if it is omitted it is assumed depending on the *type* of view:

View type	Value
DATE Text	12
DN Decimal numeric text	10
F File	30
IN Numeric unsigned text	7
N Numeric text	8
QS Qualitative slider	8
S Slider	5
P Password	16
R Radio button	12
T Text	maximum from 20 and the length of the possibly default value
TIME Text	10

### 1.2.5 Default value

Is the value proposed in form; the form is restored with the defaults values when the `Reset` button is pushed.

## 1.2.6 Extra(s)

Extra Field is used for add information to the view.

### View type

Check Box	a possible description after the check box
Radio buttons	an item list separated by
Slider	the slider limits
Qualitative slider	an item list separated by
Spinner	an item list separated by
Text Fields	if the default field is empty, is the hint; for Date is the user format

The possibly second *extra* field of text views is a ToolTip.

## 1.2.7 Pseudo types

Pseudo fields are flavors for show form; they have a type and the syntax is different from the normal views.

### 1.2.7.1 After

The pseudo field `after` is useful for insert a button or a check box or a radio buttons at right of a view:

`after,viewNameA,viewNameL`

where `viewNameA` is the view to be placed at right of the view `viewNameL`

The possible `viewNameA` views are:

- buttons,
- check boxes,
- radio buttons,
- not modifiable fields.

```
Title,,After example;
Ground,FF 8000 LEFT_RIGHT;
T,mail,,80,ross@lib.it,,Insert a valid mail;
B,Go,see.png;
check,mail Is Mail;
After,Go,mail;
N,Age,,5,75,age,Patient age;
R,AgeType,,12,Years,Y:Years|M:Months;
CMX,Symptoms,,200,,fever|rush|vomit;
After,AgeType,Age
T,fileName,File name,30;
U,Extension,,,*.png;
After,Extension,fileName
```

 In the list of views `viewNameL` must appears before `viewNameA`. and both must precede the After pseudo type.

### 1.2.7.2 Background

The pseudo field `Ground` or `Background` create a background in the form or a gradient with a possible effect of transparency; the syntax is:

`[Ground|Background] [, fromColor [toColor direction]]`

The colors are in hexadecimal notation with two digit for every component: RRGGBB, in this case the color is opaque; the transparency is a hexadecimal value from 00 to FF appended before the color, see the examples below:

```
"Ground;"                      ' default FF404040
"Ground,FF;"                   ' blue
"Ground,7F0000FF;"            ' half transparent blue
"Ground,FF 8000 LEFT_RIGHT;"   ' gradient blue to green
```

`direction` can be:

- `TOP_BOTTOM` or `TR_BL` (Top-Right to Bottom-Left),
- `RIGHT_LEFT` or `BR_TL` (Bottom-Right to Top-Left),
- `BOTTOM_TOP` or `BL_TR` (Bottom-Left to Top-Right),

- LEFT\_RIGHT or TL\_BR (Top-Left to Bottom-Right).

The default *direction* is TOP\_BOTTOM.

Color can be also one of this (non transparent): aqua, black, blue, crimson, cyan, gray, green, lightgray, magenta, olive, orange, purple, red, silver, teal, white, yellow.

 Without the pseudo field Ground the form has a gray background; for a transparent background use a 00 transparency, for example: Ground, 00000000;.

### 1.2.7.3 Check

This pseudo field is used for some controls on fields:

```
check, fieldName operator (value|fieldName) [, errorMessage]
```

where operator can be one of =, >, <, <>, >=, <= or is.

After the operator is we can have:

```
required|mail|regularExpression
...
& "T,email,My EMail,20;" _
& "P,password,type password;" _
& "P,repeatPassword,retype password;" _
& "check,email is mail,Incorrect mail form;" _
& "check,password=repeatPassword;" _
& "Check,psw is .{6#44},Password too short;" _
...
```

 if value contains comma or semicolon they must be masked (see paragraph 1.4.1).

### 1.2.7.4 Defaults

The syntax is: defaults, viewName:viewValue[,...]

defaults is useful for populate the form.

 if viewValue contains comma or semicolon they must be masked.

### 1.2.7.5 Random defaults

```
rdefault[s], ViewName[:ViewRandomValue][,...]
```

The rdefault pseudo type can be used for testing purpose. ViewRandomValue can have the syntax:

- n<sub>1</sub> n<sub>2</sub> a random value from integers n<sub>1</sub> n<sub>2</sub> extremes included,  must be n<sub>1</sub> < n<sub>2</sub>;
- a list of items separated by |.

 In case of combo box, qualitative slider and radio buttons only ViewName is required.

```
Title,,Random defaults example;
N, Integer, Integer number,7,;
DN, Real, Decimal number,10;
R, Status,,12,,M:Married|S:Single|W:Widow;
QS,Urgency,,9,Green,White|Green|Yellow|Red;
CMB,cmb,Combo box,20,,Alpha|Beta|Delta|Gamma;
S,Slider,Seek 1,6,,10 -10;
RDEFAULT, Integer:-100 +100,Real:17 97,Status,Urgency:Red,cmb,Slider:-10 10
```

### 1.2.7.6 Hidden field

Is the type H or HIDDEN; the syntax is: [H|Hidden], fieldName, value es:

```
DateTime.DateFormat = "yyyy-MM-dd HH:mm:ss"
...
```

```
"Hidden,TimeStamp," & DateTime.Date(DateTime.Now) & ";"
```

### 1.2.7.7 Image

```
Image,imageFile,[width][,left]
```

**Image** or **I** shows an image on form; the *imageFile* is a graphic file with path, if there is no path the file must be in the DirAssets folder:

ex. `Image,/storage/emulated/0/Android/arcadia.jpg;I,sermig.gif`

### 1.2.7.8 Label

For manage the view's labels:

```
label,,right|left,afterLabel
```

*afterLabel* are the possibly characters inserted after the label.

 The second value is intentionally empty and ignored.

ex. `Ground,FF 8000 LEFT_RIGHT;Title,,Label example;T,Name,,25;Label,,Right, :;`

### 1.2.7.9 Required

A list of fields that mus be inserted:

```
required,field1[,field2...]]
```

### 1.2.7.10 Section

```
section,sectionName[,condition[,condition[,...]]]
```

This pseudo type is for multi-forms, he must precede its views.

The *condition* has the form: *fieldName operator [value|fieldName]* where operator can be one of `=, >, <, <>, >=`.

Sections are displayed in the order in which they are present, a Section whit condition is displayed only if all condition are verified.

In case of multi section are added two navigation button: `fh_Foward` and `fh_Back` with caption respectively `-->` and `<--`; the `Ok` button is present only on the last section.

 the views before the first section are repeated on all form.

### 1.2.7.11 Tab

```
tab,tabTitle[,defaultIcon[,selectedIcon]]
```

`tab` allows to organize the form through a `tabHost` view; it can be used in sections.

The buttons are visible on all tabs; `defaultIcon` and `selectedIcon` are graphic files that must be present in the DirAssets.

 before the first tab there can be `ground` and `title` pseudo type, any other view is ignored.

### 1.2.7.12 Title

```
Title,name,formTitle[,backgroundColor[,titleColor]]
```

```
TITLE,Title,Send mail parameters,FF202020,red;
```

If `name` is omitted it is set to `fh_title`.

The default of `backgroundColor` is transparent.

## 1.2.8 Summary by type

### 1.2.8.1 Default and extra field

Type	Length	Default field	Extra field(s)
------	--------	---------------	----------------

<b>B</b>	Ignored possibly dis[able] or cancel	Possibly name of CallBack function
<b>C</b>	the data	
<b>CKB</b>	1 or check [ed] = checked	Possible Description at right of check box
<b>CMB</b>	value	An item list separated by   : [key:]value
<b>DATE</b>	Now or date	Format (default is MM/dd/yyyy)
<b>F</b>	Initial folder	
<b>S</b>	Initial value	Start and end value, default is 0 100
<b>T,N, DN, P</b>	Initial value	hint, tooltip
<b>U</b>	Not modifiable text	

### 1.2.8.2 Buttons

The package adds the standard buttons `Ok`, `Cancel` and `Reset`, if there are sections on all forms except the last the `Ok` button has caption --> and all forms except the first has a button with caption <-- and name `fh_Back`.

The buttons can be used both for take different actions on closing form both for show user caption instead of default `Ok`, this last can be obtained not only for `Ok` button with this syntax:

`B, [Ok|Cancel|Reset], caption`

The value of `default` field `dis[able]` is used to start the form with the button disabled.

The `extra` field contains a name of the function called when a CallBack Button is pushed, in the form: `moduleName.functionName`. or `functionName` if it is in the module which required the creation of the form.

The Ok button is replaced if there is almost one type **B** control in the list not associated, by AFTER pseudo type, to some control.

```
...
Dim fg As fgen      ' instantiate Form Generator class
...
Dim frm as String = "N,n1, Integer,10,,n2, DN, Decimal,10;B,Multiply,,10,,Main.Callback"
fg.fg(Activity,frm,"Main.handleAnswerTest","");
...
Sub Callback(btnName As String)    ' CallBack event handler
    Dim n1 As Float = fg.iIF(IsNumber(fg.valueOf("n1")),fg.valueOf("n1"),0)
    Dim n2 As Float = fg.iIF(IsNumber(fg.valueOf("n2")),fg.valueOf("n2"),0)
    MsgBox(n1*n2,btnName)
End Sub
...
```

The label of button can be a name of an image that must be in the asset folder or a Unicode character which is a simple and efficient way to create buttons with pictures: the Unicode characters is in the form `#nnnn` or `#xeccc` where `nnnn` is a decimal value of the Unicode character and `cccc` is s the hexadecimal value of the Unicode character.

```
B,Cancel,#x2718;
B,Reset,#x21B6;
B,Start,#9998,,myHandler,Go;
```

Name	Decimal value	Symbol	Hexadecimal value
edit	#9998	✎	#x270E
delete	#10008	✗	#x2718
check	#10003	✓	#x2713
check bold	#10004	✓	#x2714
email	#9993	✉	#x2709
cross	#10006	✗	#x2716
dollar		\$	#x24

Table 1: Some UNICODE characters

euro	€	#x20AC
pound	£	#xA3
white square	□	#x25a2
triangle down	#9660 ▼	#x25bc

### 1.2.8.3 Check box

The *extra* field can contain a possibly description at right of the check box; the *length* field is used to determine its length.

For checked box insert into *default* field `check[ed]` or 1.

The value returned of check box is a string containing 0 or 1, they must be compared as string:

```
cmd.Append(fg.iIF(fh_Data.Get("Mandatory") = "1", "M", ""))
```

### 1.2.8.4 Comment

The comment is contained in the *default* field, it occupies the space of label and view.

### 1.2.8.5 Date

The keyboard contains number and . / and - as separators.

The date inputted is checked when the field loss the focus according to the date format (the default is MM/dd/yyyy). The default value can be Now.

For set another format insert the format in the first *extra* field (is the hint):

```
Title,,Date and Time example;
Ground,Blue 80000;
Date,Date,,,Now,dd-MM-yyyy;
Time,Time;
```

### 1.2.8.6 File

The initial Folder (and possibly file name) is in *default* field to start, if it is omitted or if it is not a folder, the `File.DirRootExternal` is assumed.

### 1.2.8.7 Radio buttons

It is possible to have more than one set of radio buttons.

The *length* is the length of the single view; the *extra* field contains the item list separated by |. For get a key instead the description, the item must have the form: key:value.

The *default* value can be the data showed or the key:

```
Rdb,Status,10,R,Single,M:Married|S:Single|W:Widow;
Rdb,AgeType,10,R,Y,M:Months|Y:Years;
```

### 1.2.8.8 Slider

The *length* is the length of the text which shows the slider value.

The *extra* field of the type **S** can contains the start and end values in the form `start end`, e.g. -5 5; the range is 0 100 if omitted, if only one value is present, the default value for the second is 100; the result can have decimals depending on the difference from start and end value, see table at right; `start` can be greater of `end` e.g.:

```
Slider,,5,S,-3,10 -10
```

abs(start - end)	n. decimals
> 99	0
<100 and > 10	1
<10 and > 1	2
<1 and > 0.1	3
...	...

The qualitative seek bar (type **QS**) returns qualitative values taken from the *extra* field where they have the same syntax of the values of radio buttons:

```

...
QS,Urgency,,8,Green,White|Green|Yellow|Red
...

```

### 1.2.8.9 Spinners

**CMB** is a simple spinner, if no member is selected the value returned is an empty string; if the form has only one **CMB** spinner, there is only a cancel button and the form is exited when a spinner item is selected. The *extra* field of spinners contain the item list separated by | (see description in Radio button).

**CMT** type is a spinner with text associated for insert a possibly value not in spinner.

**CMX** type is a spinner with text, every choice in spinner is recorded in the text, this is useful for example to compile a list of symptoms.

### 1.2.8.10 Text fields

For text type (**T**, **P**, **N**, **IN**, **DN**) the possibly *extra* field is the *hint*; the possibly second *extra* field is the ToolTip.

### 1.2.8.11 Time

The keyboard contains number and : (colon). The value is checked when the field loss the focus; the hour can be inputted without the leading zero.

### 1.2.9 Returned Values

The data are accessible in the Sub indicated as third parameter of the call, which is called when the buttons Ok or Cancel or the possible type **B** button is pushed.

The sub has a parameter which is the map which contains the data which are accessible via `Get` or `GetDefault` methods: the key is the field name, besides there is the element with key `fh_button` which contains the name of the button pushed (Ok or Cancel or the name of the button pushed).

 If Cancel button was pressed there is only `fh_Button` element.

## 1.3 CallBack

FormGen works on CallBack not only at the end of form, but also, possibly, for handle events (the fourth parameters of the call), or by a sub associated to a **B** button (the *extra* field). The CallBack function receive the button name.

### 1.3.1 Handle Events

This function can be used to personalize the form e.g. modify the state of the view, perform controls and so on. The functions receive an array which contains view name and event, besides, for views, contain the view handle, the value and possibly extra field, see below.

Parameters		
	Event	Note
<code>event</code>	Start	view name = <code>fh_start</code> , no view handle and value.
<code>event</code>	Cancel	view name = <code>fh_cancel</code> , no view handle and value.
<code>event</code>	End	view name = <code>fh_end</code> , no view handle and value.
<code>event</code>	Reset	view name = <code>fh_reset</code>
<code>event</code>	SETVALUE	when a value is set by program ( <code>setValue</code> function)
Buttons	CLICK	
EditText	FOCUS, LFOCUS	Focus and lost focus.

EditText	VREND	At end of Voice recognition (if is active)
Check box	CHK	Value = 1 if checked, else 0
Seek bar	SLIDE	Extra is the handle of text containing the value.
Spinner text	CLICK	
Tab	OPEN	TABactual, OPEN,TABbefore

The button CLICK event precedes the closing of the form, however, it is possible to inhibit the closing by setting the property `fh_yesToExit` to False.

```
Sub handleEvents(parm() As Object)      ' widget events handler
    Dim value As String = ""
    If parm.Length > 2 Then
        If parm.Length > 3 Then value = parm(3)
    End If
    Log("Handle event " & parm(0) & " event: " & parm(1) & " Value: " & value)
    Select parm(0)
        Case "fh_start","fh_reset"
        Case "Message"
            If parm(1) = "VREND" Then
                Dim txt As String = parm(3)
                parm(3) = txt.Substring(0,1).ToUpper & txt.substring(1) & "."
            End If
        Case "Parms"
            fg.fg(Activity,"Prova,,,t",Me,"handleAnswer","handleEvents")
        Case "Send"
            sendMail(parm(0))
            fg.fh_yesToExit = False
    End Select
End Sub
```

### Example of sub for handle events

#### 1.3.2 Handle CallBack

The function is called when a type **B** button with call back function (the *extra* field) is clicked; the function receive the name of the button. The values of view can be accessed by the function `valueOf(viewName)`.

```
Sub Globals
...
    Dim fg As fgen      ' instantiate Form Generator class
...
    Dim Finder As String = $"T,Name;CMB,list,List;B,Find,-->,6,,loadNames;"$ _ 
        & $"B,New;B,Ok,See,,disabled;After,Find,Name;H,app,listProd"$ _
...
End Sub
...
fg.fg(Activity,"Title,title,Find Products;" & Finder,Me,"handleAnswer","","")
...
Sub handleAnswer(fh_Data As Map)
    If fh_Data.Get("fh_button") <> "Cancel" Then
...
    End If
End Sub
Sub loadNames(btnName As String)
    MsgBox(fg.valueOf("app"),"")
End Sub
```

### Sample of Callback function

We can also manage the CallBack in the event management function, in this case it is not necessary to specify a dedicated function.

## 1.4 Remarks

### 1.4.1 Masking comma and semicolon and insert Unicode characters

If *label* or *default* or *extra* or condition contains commas or semicolons, the function `mask(data)` must be used, commas are replaced by #44 and semicolons by replaced by #59<sup>1</sup>:

```
Dim cmd As StringBuilder  
...  
instantiatedName.mask(data_to_be_masked)  
cmd.Initialize  
cmd.Append(fh_Data.Get("Name") & ",")  
cmd.Append(fg.mask(fh_Data.Get("Label")) & ",")  
cmd.Append(fh_Data.Get("Length") & ",")  
cmd.Append(fh_Data.Get("Type"))  
cmd.Append(", " & fg.mask(fh_Data.Get("Default")) & ",")  
cmd.Append(fg.mask(fh_Data.Get("Extra")))
```

### 1.4.2 Handling Buttons

Form Generator inserts the `Ok` button, the `Cancel` button and the `Reset` button depending on the views contained in the form:

- the `Cancel` button is always present,
- the `Reset` button is present if there are data fields,
- the `Ok` button is not present if there is only one spinner (**CMB** type) or some others buttons.

If the form contains only not modifiable views (*type U*), there is only the `Cancel` button.

The Forward (--) and Back (<--) buttons are always present in case of multi sections.

### 1.4.3 Data presentation

The data are presented in the order they appears in the parameters list, except for the Type **B** buttons that appears together buttons inserted by *FormGen*, at the bottom of the form.

For view of Type Text, if the length exceed the maximum characters allowed for the line, the view is multi lined; this maximum characters for line depends from the labels width.

With the pseudo type `after` buttons or check box can be placed at right of another view.

### 1.4.4 Work with views

We can modify the view properties getting the view by the function `getHandle`; therefore for some properties there are specific functions:

- enable view: `enable(viewName)`
- disable view: `disable(viewName)`
- get the handle of the view: `getHandle(viewName)` In case of radio button is the handle of radio button checked.
- Change the value: `setValue(viewName, value)`
- Get the view value: `valueOf(viewName)`

Examples:

```
fg.disable("btnGo")
```

<sup>1</sup> For compatibility are accepted the deprecated `chr(1)` for comma and `chr(2)` for semicolon.

```

Dim lbl As Label = fg.getHandle("title")
lbl.TextColor = Colors.Green
If fg.valueOf("Consent") = 1 Then fg.enable("btnGo")
fg.SetValue("Slider", 0.2)
fg.setValue("Number", 400)
fg.setValue("Spinner", "Delta")
fg.setValue("UnMod", "*****")
fg.setValue("Rdb", "Married")

```

### 1.4.5 Voice recognition

It is possible to use voice recognition for enter text spoken into text field; this is done by the function `startVoiceRec`.

Voice recognition is deactivated, for enable uncomment:

```

'Dim VR As VoiceRecognition
'VR.Initialize("VR")
Sub startVoiceRec()
    'VR.Listen 'calls the voice recognition external activity
End Sub

```

In the event VREND we can access the text and modify (see the above example).

```

Sub handleEvents(parm() As Object)           ' widget events handler
    Dim value As String = ""
    If parm.Length > 2 Then
        If parm.Length > 3 Then value = parm(3)
    End If
    Select parm(0)
        ...
        Case "Message"
            If parm(1) = "VREND" Then
                Dim txt As String = parm(3)
                parm(3) = txt.SubString2(0, 1).ToUpperCase & txt.substring(1) & "."
            End If
        ...
    End Select
End Sub

```

## 1.5 Others functions and utilities

*FormGen* module contains, may be, useful functions; some are just seen above at paragraph 1.4.4 Work with views.

### 1.5.1 Add values to spinner

```
splitKeyValue(name As String, data As String) As List
```

Where `name` is the spinner name, `data` is a string of items in the form: [key:]value. separated by |.

The `splitKeyValue` populates the `mapValues` map; the returned List is used to populate the spinner.

```

Dim cmb As Spinner = fg.getHandle("listProp")
cmb.clear
cmb.addall(fg.splitKeyValue("listProp", fg.implode("|", listExpl)))

```

### Dialog method

~~This method is experimental, it is based on deprecated `doEvents()`, and don't works on B4A 7.~~

```
Dialog(act As Activity, title As String, Default As String) As String
```

This method asks an input string modal:

```

...
Dim fg As fgen ' instantiate Form Generator class
...

```

```

fg.Initialize
...
name = fg.Dialog(Activity, "Get Name", "Unknown")

```

### 1.5.2 iIf

iIf function return an object depending on a test:

```

Dim Number As Int = fg.valueOf("Number")
Log(Number & " is " & fg.iIf((Number Mod 2) = 0, "even", "odd"))

```

### 1.5.3 Right and Left string functions

Right and Left functions returns a pieces of string stripped by some extent:

```

Log(fg.Left(fg.Right("Condor Informatique", 12), 6))      ' Inform

```

### 1.5.4 Get filename components

**pathinfo**<sup>2</sup> returns a map containing information about a file ex:

```

Dim fileInfo As Map = pathinfo("/www/htdocs/index.html")
• dirname      /www/htdocs
• basename     index.html
• extension    html
• filename     index

```

### 1.5.5 Get the widget Handle

```

Dim cmb As Spinner = fg.getHandle("listProp")
cmb.clear
cmb.addall(fg.splitKeyValue("listProp", fg.implode("|", listExploiteurs)))

```

 the handle of a not modifiable field (U) is a label handle.

 For Combo Text (**CMT**) and Combo Extended Text (**CMX**) the handle is relative to the text associated with the spinner, for access to the spinner:

```

Dim cmbTxt As View = fg.getHandle("Commune")
Dim aWdg() As Object = fg.widgetRef.Get(cmbTxt.Tag)
Dim cmb As Spinner = aWdg(3)
...

```

### 1.5.6 Extend Log function

**toText** is a function for speedy logs; it has two parameters, the first is a string containing some text and a formatting command (% or %n or %n.d), the second is an array of object. Every % is replaced by an element of the second parameter. The possible n is a length of output, the possible d is the number of decimals to show.

```

Dim aaa() As Object
aaa = Array As Object (3, 3.14, "vintun", False, True, 18723)
Dim t As String = "% %6.3 %11 %1 aaaa %3 %12.2"
Log(fg.toText(t, aaa))

```

The result is:

```

3 3.140 vintun      f aaaa tru    18,723.00

```

### 1.5.7 Implode

```

implode(separator As String, obj As List) As String
implodeFrom(separator As String, obj As List, From As Int, At As Int) As String

```

**implode** function returns a string containing all elements of an array or list with separator between each element:

```

Log(fg.implode("<br>", aaa))

```

<sup>2</sup> This is similar to PHP pathinfo function.

The result is:

```
set<br>3<br>3.14<br>vintun<br>false<br>true<br>18723
```

### 1.5.8 TypeOf Object type

`typeof` is a function which return a type of object, stripping `java.lang` from what is returned by `GetType` `Basic4Android` function.

```
Select TypeOf(values(j))
Case "Integer", "Double"
...
```

### 1.5.9 Sand box

The Sand box is a demo of `FormGen` and a tool for testing the forms. The initial form, not created by `FormGen`, has a text box and some buttons:

- Add button generate a form for create a view.
- Test button generate a form starting from what is contained in the text box.
- Button for generate samples of selected type.
- Sample button generate a sample form with some views and a CallBack button.

## 2 Technical notes

### 2.1 Library

Form generator need Core library and Phone library (if use Voice recognition).

### 2.2 Maps

Name	Key	Value	Note
allButtons	<code>ButtonName</code>	<code>Array(Caption,CallBack)</code>	String array
after	<code>viewAfter</code>	<code>viewBefore</code>	
checks	Field name	control on view <sup>(1)</sup>	array of comma separated checks (1)
Defaults	Field name	<code>value</code>	#44
Elem	Field name	<code>array field description</code>	
fh_Data	Field name	<code>value</code>	map of data
fh_FieldsType	Field name	Field type	
hiddensMap	Field name	<code>value</code>	map of hidden fields
limits	<code>fieldNameMin,</code> <code>fieldNameMax,</code> <code>fieldNameDelta,</code> <code>fieldName (QS type)</code>	<code>value</code> <code>items (QS type)</code>	Slider limits; for qualitative slider are list of values
mapValues	Field name & value	<code>key</code>	For Radio buttons and Combo box (spinner)
	Field name & key	<code>value</code>	
required	<code>Field name</code>		for required fields
tabsMap	Page name	<code>Array (3)</code>	
tipsMap	Field name	<code>tip or label</code>	label after file view for show

			folder
widgetRef	Field name	Id, widgetType, label, extraField1	(2)

1) checks contains arrays:

- operator
- (value|fieldName)
- possibly error message.

2) widgetRef contains a reference to all view and TITLE pseudo field

1. key = *fieldname*, value = array(Id, widgetType, label, extraField)
2. Id is a widget ID, for RadioButtons is a panel container
3. extraField is:
  4. for button a possibly sub for CallBack,
  5. for seekbar (type S) is the ID of text containing the value,
  6. for file (type F) is the file path,
  7. for spinner text (type CMT and CMX) is the ID of the spinner associated.
  8. for RadioButton is a radiobutton selected.

3) tabsMap contains data for tab

- background color e.g. FF 8000 LEFT\_RIGHT,
- possibly defaultIcon,
- possibly selectedIcon,
- title array (Name, title, background color)

## 2.3 Lists and arrays

- rdbList the data array contains normalized RadioButtons data description.
- Sections two dimension array (number of sections, 3):
  - section widgets,
  - section name,
  - check condition(s).

## 3 History

### Version 0.3.1.1

- Button with cancel in default field for do not show cancel button

### Version 0.3.1

- function implode accept in addition to the Arrays also Lists,
- a form with only a single spinner exits when an element is selected.
- pseudo field GROUND added

### Version 0.4.x

- the ground is set to black, if no ground is present,
- added checks pseudo field for add controls,
- add comments,
- the fields describing the view are rearranged, the type is the first item, this permits a neatest evolution of the software,
- eliminated the mandatory (M) character for the fields that must exists, this is replaced by the pseudo type required,

- added the pseudo type `defaults` and `after`,
- choice of the caption for buttons `Ok`, `Cancel` and `Reset`,
- pseudo type `Hidden`.

Version 0.5.x

- Dialog method,
- qualitative slider,
- check improved by comparison operators,
- multi form management,
- Graphic button and button with Unicode characters.

Version 0.5.3

- Eliminated BC type

Version 0.6.2

- added the C (comment) type

Version 0.7.0

- Error messaging has been improved,
- added Tab pseudo type,
- minor corrections.

Version 0.7.3

- Improvement of **After** pseudo type: the presence of views involved is controlled and also the not modifiable type (**U**) can be altered.
- Support of `android:minSdkVersion="5"` `android:targetSdkVersion="19"` instead of: `android:minSdkVersion="4"`

Version 0.7.6

- Added pseudo type `RDefault`

Version 0.8.0

- Added Date and Time widget,
- fields are checked when lost focus,
- text fields are sentence capitalized,
- some colors are accepted by name,
- added the type `IN` integer positive number,
- Sand Box improved.

### 3.1 Differences of version 4.x from previous version

#### 3.1.1 Buttons

- Default field of type **B** buttons can contain the disable command, instead of the value returned when the button is clicked; the value returned is the button name.
- Removed the option `cancel` in default field of button for do not show `Cancel` button.

#### 3.1.2 View list

The fields are rearranged, the type is the first item, this permits a neatest evolution of the software.

#### 3.1.3 Others

- Removed functions `stripFile`. it has substituted by `pathinfo` that returns directory, file name and extension.

- Eliminated the mandatory (M) character for the fields that must exists, this is replaced by the pseudo type required.

### 3.2 Differences of version 0.5.3 from previous version

Eliminated the BC button, the call back is implicit if the *extra* field is not empty.

The Tip *pseudo type* has been eliminated, the tip is on the second *extra* field of text views.

### 3.3 Differences of version 0.6.x from previous version

The form of calling has changed:

```
instantiatedName.fg(activity, dataDescription, callingModule, subHandleAnswer, subHandleEvents)
```

The *callingModule* is an activity module or a class module *subHandleAnswer* and *subHandleEvents* are the name of subs concerned. This change has become necessary to be able to call between modules.

## 4 Known issues

- The comment field (C type) must be better sized.
- When the data fields are only not modifiable (U type) there is only the Cancel button.
- The qualitative seek bar (QS type) can't be empty.
- The Date field is checked by DateTime.DateParse which, to date, accepts dates whose year contains three digits for format yy, or more than four for format yyyy.

## 5 Annexes

### 5.1 Introduction to regular expressions

A regular expression is a string of characters used to search, check, extract part of text in a text; it has a cryptic syntax and here there is a sketch with a few examples.

The regular expression can be prefixed by modifiers such as `(?i)` to ignore the case.

The expression is formed with the characters to search in the text and control characters, among the latter there is a \ said *escape* used to introduce the control characters or categories of characters:

- \ escape character, for special characters (for example asterisk) or categories of characters:
  - \w any alphabetical and numerical character, \W any non alphabetical and numerical character,
  - \s white space namely. tabulation, line feed, form feed, carriage return, and space,
  - \d any numeric digits, \D any non digit,
- . any character,
- quantifiers, they apply to the character(s) that precede:
  - \* zero or more characters
  - + one or more characters
  - ? zero or one character (means possibly)
  - {n}, {n,} and {n,m} respective exactly n characters, almost n characters and from n to m characters .

(...) what is between parentheses is memorized,

?=pattern checks if pattern exists,

[a-z] any letter from a to z included,

[a | b] a or b,

\b word boundary,

\$ (at the bottom),

^ (at start).

#### 5.1.1 Examples

<code>^\s*\$</code>	Empty set or white spaces
<code>aa+</code>	Find a sequence of two or more a, like aa, aaa,....
<code>(\w+) \s+ (\w+) \s+ (\w+)</code>	Find and memorize three words
<code>(\-[a-z])</code>	Find and memorize minus followed by one alphabetic character
<code>.(jpg jpeg)\$</code>	Controls file type jpg or jpeg
<code>^[a-zA-Z0-9._-]+@[a-zA-Z0-9.-]+\.[a-zA-Z]{2,4}\$</code>	Control of mail address
<code>^\d+\$</code>	Only integers
<code>((?=.*\d) (?=.*[a-z]+) (?=.*[\W]).{6,12})</code>	<p><code>(?=.*\d)</code> almost a digit from 0-9  <code>(?=.*[a-z])</code> almost one lowercase character  <code>(?=.*[\W]+)</code> almost one special character  <code>.</code> match anything with previous condition checking  <code>{6,12}</code> length at least 8 characters and maximum 12</p>
<code>^[-+]?(\d{1,2})(\.\d{1,2})? \$</code>	<p><b>Numeric values</b></p> <p><code>[-+]</code> ? the sign is possible  <code>\d{1,2}</code> one or two digits  <code>(\.\d{1,2})?</code> It is possible to have a decimal point followed by one or two digits</p>
<code>[aAbBcCdDeEFF\d]{8}</code>	8 hexadecimal digits
